No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                 The present invention describes recombinant human mannan-binding protein (rhMBP) having a molecular weight range of 1000-1300 or 200-400 kDa (by gel filtration with detection at 280 nm). rhMBP may be used as a component of drug compositions for the inhibition of haemagglutination and prevention of infection by viruses such as influenza and HIV. The present sequence represents hMBP (human mannan-binding protein)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             80
                                             Recombinant human mannan-binding protein expressed using pNOW1 vector.

The present invention describes a method (I) for the production of a human recombinant mannan binding lectin (rMBL) composition (C) having size distribution profile at least 50% identical to wild type MBL. The method involves preparing a gene expression construct (EC) encoding MBL or its functional equivalent, transforming a host cell culture (HC) with EC, cultivating HC, subjecting the culture medium to affinity chromatography and obtaining eluate comprising (C). (C) can have cytostatic, anti-HIV, neuroprotective, anticonvulsant, antirheumatic, antiarthritic, dermatological, immunosuppressive, antiinflammatory, vasotropic, antiasthmatic, antiarteriosclerotic, immunostimulant, antipsoriatic, antiasthmatic, antiatiated cascade. A pharmaceutical composition comprising (C) can be used for the treatment of infections, MBL deficiency, cancer, immune and reproductive system disorders associated with chemotherapy, miscarriages, disorders associated with neutropaenia and human immunodeficiency virus (HIV). (C) is useful for the treatment of conditions of diseases and disorders in connection with immunosuppressive chemotherapy including, in

The invention relates to a methylotrophic yeast strain (I) comprising a DNA molecule encoding mannose-binding protein (MBP), protein disulphide isomerase (PDI), heat shock protein 47 (hsp47), and propyl-4-pytoxylase (P4H), where upon culturing (I) produces the MBP, PDI, hsp47 and P4H. (I) is useful for producing MBP comprising culturing (I) under conditions suitable for the secretion of MBP by the yeast where MBP is utilised in disposal of pathogenic organisms by opsoniasing pathogen or activating complement cascade. The methods utilising (I) result in high yields of MBP without the use of foetal calf serum, in a cost-effective manner. The present sequence relates to the amino acid sequence of human mannose-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Methylotrophic yeast strain, useful for producing mannose-binding protein, comprises DNA molecules encoding the protein, protein disulfide isomerase, heat shock protein 47 and propyl-4-hydroxylase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; mannose-binding protein; MBP; methylotrophic yeast strain; protein disulphide isomerase; PDI; heat shock protein 47; hsp47; propyl-4-hydroxylase; P4H; pathogenic organism disposal; biocide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        24 0 0 0 0 0 0 8 8 8

The invention relates to a novel pharmaceutical composition comprising additives and at least 200 micrograms/ml protein containing material where mannan binding lectin (MBL) and/or MBL variant constitute at least 25% {w/w} of total protein, or comprising at least 400 micrograms/ml MBL associated serine protease(s) (MASP) or its fragments, particularly MBL-associated serine protease(s) (MASP) or its fragments, particularly MSP-1, MASP-2 or MASP-3 having respectively the 699, 686 or 728 amino acid sequence fully defined in the specification. The MBL preferably has the 248 sequence fully defined in the specification or it's fragment and may be purified naturally occurring human serum MBL or recombinant and immunostimulant activities. The composition can be used to treat a clinical condition, particularly an infection, especially where the individual has a subnormal MBL level. The composition may be used to treat immunocompromised conditions. This sequence represents the 248 amino acid mannan binding lectin protein of the invention. 120 180 240 100 360 AATCCAGGGCCTTCTGGGTCACCAGGACCAAAGGGCCAAAAAGGAGACCCTGGAAAAGT 300 120 9 20 40 9 80 nceutical composition containing mannan binding lectin or its is useful to treat clinical conditions, particularly infection, 1 ATGLCCCTGTTTCCATCACTCCCTCTCCTTCCTGAGTATGGTGGCGCGTCTTACTCA MetSerLeuPheProSerLeuProLeuLeuLeuLeuSerMetValAlaAlaSerTyrSer GAAACTGTGACCTGTGAGGATGCCCAAAAGACCTGCCCTGCAGTGATTGCCTGTAGCTCT GluThrValThrCysGluAspAlaGlnLysThrCysProAlaValIleAlaCysSerSer CCAGGCATCAACGCCTTCCCAGGCAAAGATGGGCGTGATGGCACCAAGGGAGAAAAGGGG ProGlyIleAsnGlyPheProGlyLysAspGlyArgAspGlyThrLysGlyGluLysGly GAACCAGGCCAAGGCTCAGAGGCTTACAGGGCCCCCCTGGAAAGTTGGGGCCTCCAGGA GluProGlyGlnGlyLeuArgGlyLeuGlnGlyProProGlyLysLeuGlyProProGly ProAspGlyAspSerSerLeuAlaAlaSerGluArgLysAlaLeuGlnThrGluMetAla CCGGATGGTGATAGTAGCCTGGCTGCCTCAGAAAGAAAGCTCTGCAAACAGAAATGGCA 248 248 0 0 0 0 0 Length: Matches: Conservative: Mismatches: Indels: (1-248)English and immunosuppressive conditions. ```
MBP is a soluble lectin-like molecule which is synthesised in hepatocytes and released into the bloodstream. Human MBP binds carbohydrate and can selectively recognise configurations of high mannose, fucose or N-acetylglucosamine which are present on pathogens. Interaction of MBP with mannose-rich pathogens enhances clearance of the pathogens by phagocytosis or results in activation of complement. Sequences (cDNA and genomic DNA) coding for human MBP have been isolated. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              160

The invention relates to cancer inhibiting agents that contain an active component, mannan-binding protein (or the gene encoding it). Mannan-binding protein (MBP) has carcinostatic activity, and can be used as the active component in anticancer agents for inhibiting tumour growth and suppressing the proliferation of a cancer into surrounding tissue. Alternatively, the gene encoding MBP may be delivered to the tumour in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Carcinostatic agent containing mannan-binding protein - inhibits cancer growth and proliferation into surrounding tissues.

                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to polynucleotides encoding a new collectin of human origin. The collectin can be used as an antibacterial and antiviral agent and for screening potential drug molecules. The new collectin can be produced by standard recombinant methodology. The present sequence represents a human MBP, used in homology studies with collectin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

plasmid or viral vector (especially in a vaccinia or adenovirus vector). The MBP may be human MBP, or derived from it by addition, deletion and/or substitution of one or more amino acid residues. The agents containing the MBP can be used for effective treatment of malignant tumours (including solid tumours) by direct application to the tumour. The present sequence represents a MBP sequence

(expression) vectors and cells contg. it, peptides encoded by it, and antibodies (Ab) against these peptides. Peptides encoded by it, fused to a toxin, are used to treat animals infected with bacterial, fungal or viral (including HIV) pathogens. They bind to mannose units on such organisms and cause host defence cells to be attracted to them. The peptides inhibit growth or infection (esp. in HIV, where concn. is 1-500 antibodies are useful in diagnosing susceptibility to infection (by BLISA). (Updated on 25-MAR-2003 to correct PD field.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the isolation of a novel pig serum lectin gene which encodes a protein with affinity for a phosphomannan. The protein was isolated on a phosphomannan affinity column generated by coupling phosphomannan from cultured Hansunela capsulata to an epoxy column. The pig lectin can be used as a new physiologically active substance

                                                                                                                         ₹
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to polymucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CCAGGCATCAACGCTTCCCAGGCAAAGATGGGCGTGATGGCACCAAGGGAAAAGGGG 180

The present sequence is the protein sequence of a novel form of human surfactant protein D (SP-D) that is expressed in endothelial cells, inhibits oxidation of low density lipoprotein and protects endothelial cells, calls from oxidative damage. The andothelial form polypeptide lacks 93 amino acids compared to the lung form of SP-D and has only 28 Gly-Xaa-Xaa repeats as compared to 57 in the lung form of SP-D much bench on the invention provides a novel method of diagnosing a percon's susceptibility for having an increased risk for the development of atherosclerosis by masuring the amount of SP-D in plasma and serum samples. An increased risk for the development of atherosclerosis in a human is considered at a detected serum or plasma SP-D concentration below 1104.6 mg/ml, in the particular below 743 mg/ml, and especially below 370 mg/ml or 152.7 mg/ml. SP-D, or a nucleic acid encoding it, can be used to prevent or treat an atherosclerosis related disease such as stroke, kidney failure, and interest and process and process of the prevent or treat an atherosclerosis related disease such as stroke, kidney failure, and myocardial infarction, and to treat obesity
                                                                              Human; surfactant protein-D; SP-D; atherosclerosis; antiarteriosclerotic;
antidiabetic; gene therapy.

                                                                                                                                                                                                                                                     The invention relates to polynucleotides encoding a new collectin of human origin. The collectin can be used as an antibacterial and antiviral agent and for screening potential drug molecules. The new collectin can be produced by standard recombinant methodology. The present sequence represents a human SP-D, used in homology studies with collectin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GACCCTGGA---AAAAGTCCGGATGGTGATAGTAGCTG-----GCTGCCTCAGAAAGA 336

The invention relates to a method of treating conditions associated with lipid oxidation, acute lung injury, atherosclerosis, inhibiting or reducing microbial contamination, preventing microbial proliferation, contamination or colonisation, and preventing spoilage of foods, cosmetics and medications. The method involves using an antioxidant or antimicrobial lung surfactant protein compound. The method is also useful for treating adult respiratory distress syndrome and hyperoxic lung injury. The surfactant proteins are advantageous over antioxidant ingredients such as butylated hydroxy toluene (BHT) or antimicrobial products, since they are derived from animal sources, are edible and are non-toxic. The present sequence represents human lung surfactant protein D used in the method of the invention

The invention relates to a recombinant surfactant protein D (rSPD) (n/CRD) polypeptide (I), or its fragment, homologue, variant or derivative, for use in treatment or prophylaxis of a disease. (I) is useful for treating an individual suffering from a disease or preventing the occurrence of a disease in an individual, where the disease comprises an inflammatory a disease, preferably eczema or an inflammatory lung disease (selected from neonatal chronic lung disease, neonatal respiratory distress syndrome (RDS), adult respiratory distress syndrome, chronic obstructive airways disease (COPD), asthma, cystic fibrosis, pulmonary fibrosis, emphysema, interstitial inflammatory lung disease, sarcoidosis, pneumonia, chronic inflammatory lung disease, neonatal chronic inflammatory lung disease, and allergy (see ACC48168 for a detailed description of all the diseases surfactant protein (SP-D)
                                                                                                                                                                                                                                                                                                                                                                                                             Novel recombinant surfactant protein D, termed rSPD n/CRD polypeptide, or its fragment, homolog, variant or derivative, useful for treating inflammatory diseases, asthma, allergy, or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  149 AlaProGlyMetGlnGlySerAlaGlyAlaArgGlyLeuAlaGlyProLysGlyGluArg 168

The present sequence is bovine conglutinin (bCG), from which a novel recombinant bCG can be prepared. The recombinant bCG comprises a truncated collagen region of formula Gly-Xaa-Xaa-Gly-Xaa-Xaa (where Xaa is any amino acid), and the neck and sugar chain recognition regions of natural bCG. The recombinant bCG has antiviral activity, i.e. virus neutralising activity, and can be used to treat viral diseases,
